

Student ID:	MAD Quiz 2	Marks: 15 and Duration: 10 minutes
-------------	------------	------------------------------------

A software company has been commissioned to develop a Mobile Learning Management System (m-LMS) for a university to facilitate seamless access to academic resources and services through smartphones and tablets. The application is expected to provide course materials, announcements, assignment submissions, student performance analytics, and grade reports. Furthermore, students should be able to quickly navigate between major modules such as Courses, Assignments, Results, and Messages. During the testing phase, several usability concerns were identified. Students reported difficulty navigating between different sections of the application and locating frequently used features. In addition, grade reports are currently displayed using large traditional tables that are difficult to view and interpret on mobile devices with limited screen space. The development team is evaluating different mobile design patterns, including persistent navigation, transient navigation, dashboard, and tab menu patterns, but is uncertain about which approaches would provide the best user experience and usability.

1. Identify and analyze three major design and usability problems present in the above scenario related to mobile application development and mobile design pattern usage. Justify your answer. [3x2.5 marks]
2. Recommend appropriate mobile design patterns to address the each identified issue. Explain how your proposed solutions would improve usability. [3x2.5 marks]
