## **Lab 06 Tasks**

---

There are five labs in IUT, and each lab operates with their own single switch, allowing all the devices to communicate with one another. Build this network in omnet++. You need to add minimum 2 end devices to each of the labs. The simulation will run for 15 seconds. The packet size is fixed at 500 bytes. Take sender and receiver from each labs. For any other physical and network properties you can assume any values.

### **Task 1: Build and run the topology given the description (40 pts):**

1. Create the project and implement .ned (15 pts)
2. implement .ini (10 pts)
3. Run the simulation in Qtenv and demonstrate that hostA pings hostB successfully (5 pts).

**Total: 30 pts**
